power contactors

4 POLE

SIEMENS

Introduction :

The 4 pole contactors type 3RT13 and 3RT15 are specially designed to meet specific applications. These contactors are highly reliable, user friendly and meets the expectation of world class Siemens products. They conform to the latest IEC60947-4-1 standard and carry CE marking.

Application:

Some of the common applications of 4 pole contactors are:-

- As incomer in a source changeover systems requiring neutral isolation.
- 2 pole, AC1 applications (using 2 poles in parallel, 1.8 times rating).
- As contactors for DG incomer.
- Isolating powers systems with unearthed or poorly earthed systems.
- Switching resistive loads.
- Changing the polarity of hoisting gear motors.

Features:

High on performance and reliability:

Superior design of current carrying parts, magnet and the contact systems ensures a high mechanical and electrical life of the contactors.

High on operator safety:

The 4 pole contactors have the patented Siemens SIGUT® termination technique. The finger touch proof terminals prevent accidental contact with live parts thereby ensuring operator safety.

User friendly and ease of maintenance

Ready to wire terminals, cable end stops and predetermined insertion depth reduces the wiring time considerably. Also identification and replacement of coils is relatively simple which reduces maintenance time.

Accessories:

a) Add on Auxiliary contact block:

3RT13/15: Facility to add on a maximum of 2 auxiliary contacts (1 NO or 1 NC) for contactors size S0 (Pls. Check with us in case 4 auxiliary contact blocks are required) and up to 4 Auxiliary contacts for contactors of size S00, S2 and S3.

b) Mechanical Interlocking kit:

Front mounting mechanical interlock kit is available for interlocking two 4-pole contactors of the same size.

c) Surge Suppressor:

The surge suppressors are available as an accessory for the entire range of 4 pole, AC1 duty contactors, to limit the voltage surges. Hence the contactors are suitable for use in conjunction with electronic circuits. The surge suppressors can be snap fitted onto the contactor.

Installation:

The 3RT13/15 contactors are suitable for screw mounting on to a base plate or snap fitting on to a standard 35mm Din rail (75mm for S3).

Selection Table

4Pole, AC1 Duty Contactors			
No of main Contacts		4 NO	2 NO + 2 NC
Size	Rating I _e (AC1) amp	MLFB * (Pls. fill in .. with coil voltage)	MLFB * (Pls. fill in .. with coil voltage)

Dimensions (mm)

3RT15 1 contactors

Size S00, screw connection with surge suppressor and auxiliary switch block

For size S00:

- 1) Auxiliary switch block
- 2) Surge suppressor

3RT13 2 and 3RT15 2 contactors

Size S0, with surge suppressor and auxiliary switch block

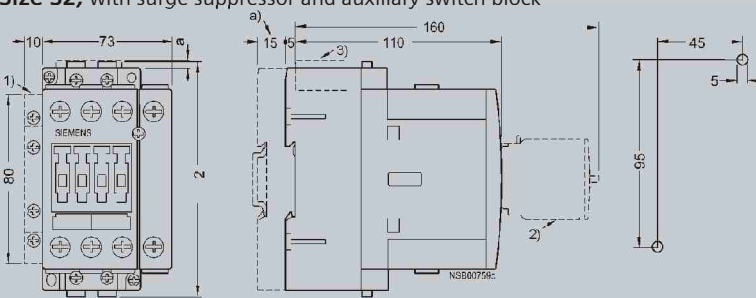

For size S0:

- a = DC 10 mm deeper than AC
- 1) Auxiliary switch block, laterally mountable (left)
 - 2) Auxiliary switch block, mountable on the front, 1, 2 and 4-pole
 - 3) Surge suppressor

3RT13 3 and 3RT15 3 contactors

Size S2, with surge suppressor and auxiliary switch block

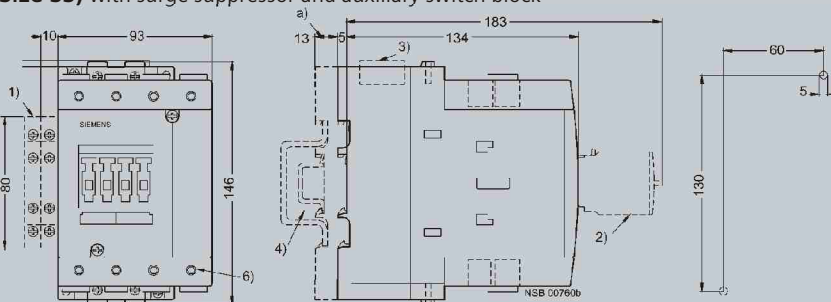

For sizes S2 and S3:

a = S2: DC 15 mm deeper than AC
S3: DC 13 mm deeper than AC

- 1) Auxiliary switch block, laterally mountable (left)
- 2) Auxiliary switch block, mountable on the front,
- 3) Surge suppressor
- 4) For mounting on 35 mm standard mounting rail (15 mm deep) acc. to EN 50 022 or 75 mm standard mounting rail acc. to EN 50 023

3RT13 4 contactors

Size S3, with surge suppressor and auxiliary switch block

Contactor Relays 3TH30

Reliability and safety are pre-requisites in the choice of the control contactor. Siemens 3TH30 contactor relays satisfy these criteria and thus offer the right choice to the customer.

Applications

3TH30 are used in control circuits for switching and signaling purpose. Also they are used for interfacing with the electronic circuits.

Standards

Contactor relay conforms to IS /IEC 60947-5-1.

They also carry CE mark.

Range

Air break contactor relays are suitable for 10A, (AC15/AC14 rating) at 240V AC and 10A, (DC13 rating) at 24V DC.

Benefits and features

Flexibility

- **Choice of auxiliary contacts**

3TH30 contactor relays comes with 4 contacts as a basic unit (4NO, 3NO+1NC, 2NO+2NC). However the contacts can be extended upto 8 contacts by adding maximum 4 auxiliary contact blocks to this basic unit. This offers flexibility in selection and configuration.

- **Choice of mounting**

3TH30 can be mounted on 35mm DIN rail and they are also suitable for screw mounting.

Long Life

Superior design of current carrying parts, contact system and the magnet system increases the reliability which also results into higher **electrical and mechanical endurance**.

High reliability

- **Double Break Parallel Bridge contact mechanism**

This mechanism is available with 3TH30. Such contact mechanism ensures reliable contact at low voltage and low currents (5mA at 17V DC). It also offers unmatched reliability as well as capability to integrate directly into PLC or instrumentation circuits.

User friendliness and safety

- **Positively driven contacts**

3TH30 auxiliary contactors satisfy the conditions **for positively driven operation** between NO and NC contacts. NO and NC contact do not close at the same time. This is extremely important when they are used in safety circuits of critical applications. This ensures operator safety even during abnormal condition.

- **SIGUT Termination**

- **Figure touch proof terminals**

It protects against accidental contact with live parts which ensures operator safety.

- **Funnel shaped cable entries**

Reduce wiring time by facilitating quick location of the connecting wire.

- **Cable end-stop**

It decides the insertion depth of the connecting wires. Since the insertion depth is predetermined, insulation of the cable can be cut accordingly and the possibility of insulation getting inadvertently caught under the terminal is avoided.

- **Captive Screws**

This feature prevents the screws from falling down thereby facilitates the wiring. Hence, the auxiliary contactors are delivered with untightened terminals. This eliminates the operation of untightening terminals before wiring.

- **Lug less termination**

This feature helps in reducing the termination time.

Accessories and ordering data

1. Surge suppressor

It is used to reduce the effect of switching overvoltages created during the opening of inductive circuits. Typically they are mounted outside the body of the contactor relay, and are connected in parallel with the coil terminals. Various techniques for the suppression of switching overvoltages can be employed. For example: RC element, Varistor etc

2. Add on blocks

Useful technical information

Variety of connections for DC applications

Power Contactors 3TF

For more than 110 years, Siemens has been developing and manufacturing industrial control products. We offer a wide product range which fulfills the demands of our customers regarding performance and reliability. Our aim is to make industrial operation easier ensuring flexible mounting, modular construction and high functionality. With 3TF contactors Siemens has been offering a tried tested trusted solution to control, switch and protect your motors upto 250kW.

Applications

3TF power contactors are suitable for switching and controlling squirrel cage and slip-ring motors as well as other AC loads, such as solenoids, capacitors, lighting loads, heating loads and transformer loads.

Standards

Contactors conform to IS/IEC 60947-4-1. They also carry the CE mark.

Coordinated feeder

Contactors and bi-relays have been tested for type-2 coordination at $I_q = 50kA$, 415V AC, 50Hz as per IS/IEC 60947-4-1, for both fuse protected as well as fuseless motor feeders.

Range

Air break contactors are available from 9 A to 475A in 3 pole version.

Also available in 2 pole AC version from 45A to 400A.

Benefits and features

Flexibility

- Choice of Auxiliary contacts

Contactor	Aux. contacts on basic unit	Permissible add-on contact blocks
9A / 12A	1 NO	Upto 4NO or 4NC
9A / 12A	1 NC	Upto 4NO or 2NC
16A/22A	-	Upto 4NO or 4NC
32A/38A	-	Upto 4NO or 4NC
45A to 475A	2NO+2NC	2 x (1NO+1NC)

The customer can order desired number of contacts thereby reducing the cost.

- Choice of mounting

Contactor can be mounted on 35mm DIN and they are also suitable for screw mounting (9-38A – DIN / Screw mounting and 45-475A – Screw mounting).

- Choice of coil voltages

AC 50Hz coil code: 3TF30 to 3TF56

Coil voltage (V)	24	42	110	230	415
Code	B0	D0	F0	P0	R0

Wide band AC 50 Hz coil code: 3TF30 to 3TF35

Coil voltage (V)	70-140	150-280	260-460
Code	W110	W220	W415

AC 50/60 Hz coil code: 3TF57

Coil voltage (V)	110-132	220-240	380-460
Code	F7	M7	Q7

DC coil code: 3TF30 to 3TF57

Coil voltage (V)	24	42	48	110	220	250 ⁺
Code	B4	D4	W4	F4	M4	N4

⁺ For 3TF3 only

(Other coil voltages are also available.)

High performance

- **No duration upto 55°C**
Contactors are suitable for operation in service temperature upto 55°C without derating. This avoids selection of higher rated contactor, thereby reducing cost.
- **Long Life**
Superior design of current carrying parts, contact system and the magnet system increases the reliability results into **higher electrical and mechanical endurance**.
- **High short-time rating**
Contactors have a high short-time rating, which makes them suitable for applications having high starting currents and long run-up times.

High reliability

- High insulation voltage and impulse withstand voltage capacity ensures reliable performance during occasional abnormal increase in supply voltage.
- **Double break parallel bridge contact mechanism**
This mechanism is available for auxiliary contacts. Such contact mechanism ensures reliable contact at low voltage and low currents (5mA at 17VDC). It also offers unmatched reliability. (Chances of 2 mal-operations in 100 mill. operations as against 4460 for single bridge contacts)

User friendliness and safety

- **Arc Chamber Interlock (45A and above)**
It prevents the contactor from switching ON, if the arc chamber is not fitted properly. Thus avoids accidents to plant and personnel.

- **Positively driven contacts**
3TF contactors satisfy the conditions **for positively driven operation** between the main power contacts and the NC contacts. NC contacts positively open before the main contact closes. This is extremely important when power contactors are used in safety circuits of critical applications.

SIGUT Termination

- **Figure touch proof terminals***
It protects against accidental contact with live parts which ensures operator safety.
- **Funnel shaped cable entries**
Reduce wiring time by facilitating quick location of the connecting wire.
- **Cable end-stop**
It decides the insertion depth of the connecting wires. Since the insertion depth is predetermined, insulation of the cable can be cut accordingly and the possibility of insulation getting inadvertently caught under the terminal, is avoided.
- **Captive Screws**
This feature prevents the screws from falling down thereby facilitates the wiring. Hence, the contactors are delivered with untightened terminals. This eliminates the operation of untightening terminals before wiring.
- **Lug less termination**
This feature helps in reducing the termination time.

* Finger touch proof terminals are available upto 85 A

3TF46 to 3TF57 - DC operation

3TF34/35 - DC operation

Accessories and ordering data

1. Mechanical interlocking kit

Mechanical interlock is required when the supply from two different sources is available. Also the same is required for the application involving reversing of motor. Here two contactors are mechanically interlocked with the help of mechanical interlock kit. This ensures closing of only one contactor at a time. Thus prevents a short circuit upon load changeover from one contactor to another.

2. Surge suppressor

It is used to reduce the effect of switching overvoltages created during the opening of inductive circuits. Typically they are mounted outside the body of the contactor, and are connected in parallel with the coil terminals. Various techniques for the suppression of switching overvoltages can be employed. For example: RC element, Varistor etc.

RC Element:

The effective increase in the capacitance of the coil circuit reduces the amplitude and rate of rise of switch off overvoltage spikes to such an extent that no rapid restriking occurs.

Varistor:

Varistor limits the maximum value of the overvoltage because they become highly conductive above a threshold value. Until this threshold value is reached, no discharge occurs for a small duration.

Selection table:

Surge suppressor (Varistor) for 3TF30-3TF35

Coil Voltage		Type	Std. pkg. (nos.)
AC	DC		
24 - 48 V	24 - 70V	3TX7 402-3GY1	10
48 - 127V	70 - 150V	3TX7 402-3HY1	
127 - 240V	150 - 250V	3TX7 402-3JY1	
240 - 400V	–	3TX7 402-3KY1	
400 - 600V	–	3TX7 402-3LY1	

Surge suppressor (Varistor) for 3TF46-56

Coil Voltage		Type	Std. pkg. (nos.)
AC	DC		
Less than 48V	24 - 70V	3TX7 462-3GY1	10
48 - 127V	70 - 150V	3TX7 462-3HY1	
127 - 240V	150 - 250V	3TX7 462-3JY1	
240 - 400V	–	3TX7 462-3KY1	
400 - 600V	–	3TX7 462-3LY1	

Surge suppressor (RC Element) for 3TF30-3TF35

Coil Voltage		Type	Std. pkg. (nos.)
AC	DC		
24 - 48V	24 - 70V	3TX7 402-3RY2	10
48 - 127V	70 - 150V	3TX7 402-3SY2	
127 - 240V	150 - 250 V	3TX7 402-3TY2	
240 - 400V	–	3TX7 402-3UY2	
400 - 460V	–	3TX7 402-3VY2	

3. Connector

The 3TS90 connector is used to mount the motor protection circuit breaker 3VU on the contactor 3TF with screw terminals. It enables mechanical and electrical connection between contactor and motor protection circuit breaker.

Range:

Size of connector	MPCB		Contactor		MLFB of Connector	Std. pkg. (nos.)
	MLFB	Current Rating	MLFB	AC3 Current Rating		
I	3VU13	0.16 to 20A	3TF30 / 31	9 / 12 A	3TS90 01-8K	1
II	3VU13	6 to 25A	3TF32 / 33	16 / 22A	3TS90 02-8K	1

Benefits:

Direct mounting of 3VU MPCB on 3TF contactor eliminates the need of power wiring and ensures secure connection. In addition, the assembly time and size of the feeder is reduced which results in cost saving. The overall assembly also looks contemporary.

Useful information

Categories of duty - as per IEC 947 / IS 13947

Current	Utilisation Categories	Typical Application
AC	AC1	Non-inductive or slightly inductive loads, resistance furnaces
	AC2	Slipping motors; starting, switching off
	AC3	Squirrel-cage motors; starting, switching off motors during running ⁽¹⁾
	AC4	Squirrel-cage motors; starting, plugging, inching
	AC5a	Switching of electric discharge lamp controls
	AC5b	Switching of incandescent lamps
	AC6a	Switching of transformers
	AC6b	Switching of capacitor banks
	AC7a	Slightly inductive loads in household appliances and similar applications
	AC7b	Motorloads for household applications
	AC8a	Hermetic refrigerant compressor motor ⁽²⁾ control with manual resetting of overload releases
AC8b	Hermetic refrigerant compressor motor ⁽²⁾ control with automatic resetting of overload releases	
DC	DC1	Non-inductive or slightly inductive loads, resistance furnaces
	DC3	Shunt-motors: starting, plugging, inching, dynamic braking of d.c motors
	DC5	Series-motors: starting, plugging, inching, dynamic braking of d.c motors
	DC6	Switching of incandescent lamps

- (1) AC3 category may be used for occasional inching (jogging) or plugging for limited time periods such as machine set-up; during such limited time periods the number of such operations should not exceed five per minute or more than ten in a 10-min period.
- (2) Hermetic refrigerant compressor motor is a combination consisting of a compressor and a motor, both of which are enclosed in the same housing, with no external shaft or shaft seals, the motor operating in the refrigerant
- (3) Selection of contactors for utilisation categories from AC-5a to AC-8b and DC6 upon enquiry.

Contact life calculation:

Contactors have bounce free operation. Electrical life is influenced by the breaking currents. For normal AC3 duty the breaking current is the rated operational current and for AC4 duty, the typical breaking current is 6 times the rated operational current. In case of mixed duty, the expected life is determined as under

$$X = \frac{A}{1 + \frac{C}{100} \left(\frac{A}{B} - 1 \right)}$$

Where

- X = expected life for mixed duty
A = expected life for normal AC3 duty
B = expected life for 100% AC4 duty
C = proportion of inching operations as a percentage of total operations.

Recommended selection of contactors for hoisting duty (upto 85A)

In hoisting operation, slipping motors are generally used. For this typical hoisting duty, we recommend the contactors listed in the following table.

Contactor Type	Stator Protection Maximum load current with hoisting motor. For intermittent duty S3				Rotor Protection Maximum load current with hoisting motor(Delta circuit). For intermittent duty S3				Max rotor standstill voltage
	25%	40%	60%	100%	25%	40%	60%	100%	
	A	A	A	A	A	A	A	A	V

* Hoisting duty contactors, designed specially for hoisting duty.

Contactors for Hoisting Duty

AC slipring motors are most commonly used for the hoisting applications. AC2 duty pertains to starting and switching off the slipring motors. In case of hoisting duty breaking current is the starting current and frequency of switching is high.

The table shows the making and breaking capacity at normal and at hoisting application where I_e indicates the rated full load current.

	Making	Breaking
During Normal operation at full load	$2.5 * I_e$	I_e
Hoisting application at full load	$2.5 * I_e$	$2.5 * I_e$
During Normal operation at partial load	less than $2.5 * I_e$	Less than I_e

Application

AC-2 operation is the typical duty for starting and switching off fully-loaded slipring motors in the starting phase. The rating of the contactor, to switch the motors, is selected primarily on the basis of rated make & break capacity and desired electrical endurance.

Standard

The contactors comply with the "Regulations to low voltage switchgear" of DIN VDE 0660 and IEC 60947-4-1.

Range

Hoisting duty contactors are available from 110A to 400A (AC2/AC3 rating).

Benefits and features

Long life

- "Hoisting Duty" Contactors are provided with new design of contacts ($AgSnO_2$ instead of $AgCdO$) resulting in **high electrical and mechanical life**.
- They are electrically superior in taking care of excessive stresses coming on contactors during their operations in crane applications.

Reliability

- The "Hoisting Duty" Contactors have vacuum impregnated coils which are suitable for high frequency switching and high vibrations. This helps in reducing coil failures.
- Side mounted auxiliary contact blocks are screw mounted and not snap fitted to withstand vibrations and high frequency operation.

Operator safety

- **Arc Chamber Interlock**
It prevents the contactor from switching ON, if the arc chamber is not fitted properly. Thus avoids accidents to plant and personnel.
- **Finger touch proof terminals**
It protects against accidental contact with live parts which ensures operator safety.

High performance

- **No derating upto 55°C**
Contactors are suitable for operation in service temperature upto 55°C without derating. This avoids selection of higher rated contactor, thereby reducing cost.

Technical Information

A. Recommended selection of contactors for hoisting duty

In hoisting operation, slipping motors are generally used. For this typical hoisting duty, we recommend the contactors listed in the following table.

Contactor Type	Stator Protection Maximum load current with hoisting motor. For intermittent duty S3				Rotor Protection Maximum load current with hoisting motor(Delta circuit). For intermittent duty S3				Max rotor standstill voltage
	25%	40%	60%	100%	25%	40%	60%	100%	
3TF50 00 0A	100	88	78	65	150	130	115	95	1000
3TF52 00 0A	145	130	115	95	220	195	170	150	1000
3TF54 00 0A	225	200	180	160	340	300	270	240	1000
3TF56 00 0A	355	325	290	250	530	490	435	375	1000

When 3 conducting paths are connected in parallel, the maximum load current rises to 2.5 times the value given in this table. When 2 conducting paths are connected in parallel, it rises to 1.8 times the value given in this table.

B. Selection of contactors for contact endurance: with normal and inching operation

Contactors suffer more erosion during inching operation than when stopping motors from a steady speed, i.e. normal operation. With slipping motors the starting current can be up to 2.5 times the rated current of the motor which means that this current has to be broken when inching is taking place. During normal operation, on the other hand, only the rated current has to be broken under full-load; under part-load it is even less. Determining contact endurance from AC-2 duty ($I_c = 2.5 \times I_e$) will only give correct results when 100% inching operation is involved.

Max. permissible current and attainable contact endurance when braking starting current given below PF ≥ 0.4 (2.5 x Ie)		Contact life when breaking the stator contactor load currents for S3-100% duty, I _c = I _e , no inching		Contactor Type
A	Operating cycles Approx.	A	Approx. Operating cycles	
275	280,000	65	3,500,000	3TF5000
425	250,000	95	3,100,000	3TF5200
625	250,000	160	2,700,000	3TF5400
1000	150,000	250	2,500,000	3TF5600

The maximum permitted current (e.g. locked-rotor current of motor) must not exceed the values given in the "Max. starting current and attainable contact endurance" column. The values cannot be increased by paralleling pole assemblies.

C. Selection of contactors for contact endurance: with mixed operation

When mixed operation is involved, i.e. primarily breaking of the motor rated current but with some breaking of higher currents due to inching, the endurance of the contacts can be calculated approximately from the following equation:

$$X = \frac{A}{1 + \frac{C}{100} \left(\frac{A}{B} - 1 \right)}$$

Where

X = Contact endurance with mixed operation cycles.

A = Contact endurance with normal operation ($I_a = I_e$) in operating cycles, from Fig. 1.

B = Contact endurance with inching operation ($I_a = \text{Multiple of } I_e$) in operating cycles, from Fig. 2, Breaking current $I_a/AC-2 = 2.5 \times I_e$.

C = Proportion of inching in total operating Cycles in %.

Fig. 1 Contact endurance of 3TF contactors as a function of breaking current when switching resistive and inductive AC loads.

Fig. 2 Contact endurance for mixed operation as a function of motor rated current. Motor on rated load, inching at 2.5 times motor rated current (slipping motor).

The contact endurance as a function of the motor rated current with mixed operation can be determined from Fig. 2 for proportions of inching of 0, 10, 20, 50 and 100%. The values obtained are only applicable if rated motor load is used continuously. In practice therefore, the contact endurance should be greater.

D. NOMOGRAM

Apart from knowing the figure for **contact endurance in operating cycles**, users are also interested to know what **period of time** this amounts to before the contacts have to be changed. The value can be ascertained from the nomogram in Fig. 3. **using the Nomogram**

Fig. 3 Nomogram for determining contact endurance in year (250 working days) and months with daily operating hours of 4, 8, 12, 16, 20 and 24 h.

Example 1

Motor rated current 150A. Selected contactor: **3TF5600**

Contact endurance in operating cycles at 400V With inching of				
0%	10%	20%	50%	100%
5.4 x 10 ⁶	4.6 x 10 ⁶	3.9 x 10 ⁶	2.3 x 10 ⁶	1.4 x 10 ⁶

Example 2

Maximum permitted motor rated current for a contact endurance of 2,000,000 operating cycles at 400V.

Stator contactor	Permitted rated current of slipping motor with inching			
Type	10% approx. A	20% approx. A	50% approx. A	100% approx. A
3TF50 00	75	68	48	33
3TF52 00	110	95	66	48
3TF54 00	175	160	125	80
3TF56 00	240	230	160	120

Draw a line from the point on the left-hand scale indicating the required number of operating cycles to the point on the right hand scale indicating the required number of operating cycles per hour. Then, from the point where this line intersects with the centre axis, draw a horizontal line to the left or right scale for the actual number of daily operating hours.

Note: If a figure of 365 days per annum is being employed instead of 250, the total operating time obtained from the nomogram must be multiplied by 0.68.

Example:

Service requirements: 1.4 million operating cycles endurance, 200 operating cycles per hour, 16 hours service per day.

Result:

Total operating time approx =18 months.

Dimensional drawing

The “Hoisting Duty” Contactors are mechanically similar to our existing 3TF power contactors. Therefore they have exactly same dimensions as the corresponding 3TF power contactors.

Please refer page nos. 21 and 22.

Useful technical information

Starting method of Slip ring motor (AC2 duty):

Three types of the contactors are used to control the three phase slip-ring motors: the stator contactor, the acceleration contactor and the rotor short circuit contactor.

Stator contactor

Initially the stator contactor (K1) is closed to energize the motor. None of the rotor contactor (K2 or K3) is closed yet. Hence all the resistances are present in the rotor circuit. The starting current can reach to 1.5 to 4 times of the rated operational current. The AC2 rating of the stator contactor is selected as per the load factor of the motor.

$$\text{Load factor} = \frac{\text{on time} * 100}{\text{Cycle time (on time + rest time)}}$$

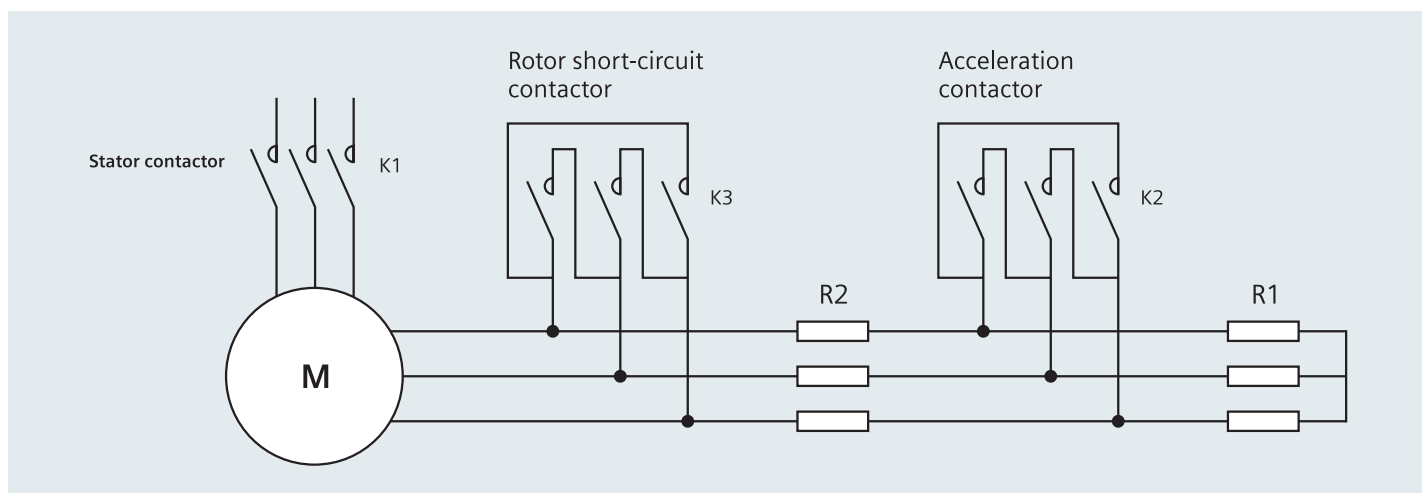

Acceleration contactor

Now acceleration contactor (K2) is closed which short circuits the resistances (R1). The sizing of this contactor (K2) is as per AC1 rated operational current. The current flow time per cycle and the number of cycles per hour has to be considered for the selection.

Rotor short circuit contactor

At the end, the rotor short circuit contactor (K3) closes, short circuiting the last resistance bank (R2) thus remove all the resistances from the rotor circuit. The starting period is hence completed. The duty of this contactors is characterized by the small closing stress. the decisive factor is the thermal stress. The duty factor is considered while finding out the permissible values of the rated operational rotor current for rotor contactors.

Picture below shows the acceleration (K2) and the rotor short circuiting contactor (K3) in the delta connection. If they are connected in star then the ratings are reduced by 35%.

AC1 Duty Contactors 3TK5

When contactors are not required to make or break current but only carry the current, the contactors can be used to its full AC1 rating. Siemens 3TK5 AC1 duty contactors can be offered in such cases.

Application

3TK5 AC1 duty contactors are widely used in sugar mills, DC drives and changeover applications. Also they can be offered for the applications like switching resistive loads, battery charging etc where the AC1 rating of the contactor is suitable.

Standards

3TK5 contactors conform to IS/IEC 60947-4-1. They also carry the CE mark.

Range

3TK5 AC1 duty air break contactors are available from 190A (AC1) to 500A (AC1) in 3 pole version.

Benefits and features

High performance

- **No duration upto 55°C**
SICOP contactors are suitable for operation in service temperature upto 55°C without derating. This avoids selection of higher rated contactor, thereby reducing cost.
- **Long Life**
Superior design of current carrying parts, contact system and the magnet system increases the reliability results into **higher electrical and mechanical endurance**.

High reliability

- High insulation voltage and impulse withstand voltage capacity ensures reliable performance during occasional abnormal increase in supply voltage.

User friendliness and safety

- **Arc Chamber Interlock**
It prevents the contactor from switching ON, if the arc chamber is not fitted properly. Thus avoids accidents to plant and personnel

- **Positively driven contacts**

3TF contactors satisfy the conditions for **positively driven operation** between the main power contacts and the NC contacts. NC contacts positively open before the main contact closes. This is extremely important when power contactors are used in safety circuits of critical applications.

Dimensional drawing

The "3TK5 AC1 duty" Contactors are mechanically similar to our existing 3TF5 power contactors. Therefore they have exactly same dimensions as the corresponding 3TF power contactors. 3TK50, 3TK52, 3TK54 and 3TK56 are having exactly same dimensions as those of 3TF50, 3TF52, 3TF54 and 3TF56 respectively.

Please refer page nos. 21 and 22.

Bimetal Overload Relays 3UA and 3UC

The 3UA / 3UC thermal overload relays are suitable for customers from all industries, who want guaranteed optimum inverse time delayed protection of their electrical loads. The relays meet the requirements of IS/IEC 60947-4-1.

Application

3UA overload relay: 3UA5/6 are 3 pole adjustable bi-metal overload relays mainly suitable for normal starting applications. They provide accurate and reliable protection to motors against overload as per CLASS 10A. They also offer protection against single phasing and unbalanced voltages.

3UC overload relay: 3UC5/6 are 3 pole adjustable, saturable CT operated bi-metal overload relays mainly suitable for heavy starting applications (i.e. when heavy masses are to be put in motion resulting in larger starting period). They provide accurate and reliable protection to motors against overload as per CLASS 30. They also offer protection against single phasing and unbalanced voltages.

If single-phase AC or DC loads are to be protected by the 3UA / 3UC thermal overload relays, all three bimetal strips must be heated. For this purpose, all main current paths of the relay must be connected in series.

Standards

Bimetal relays conform to IS/IEC 60947-4-1. They also carry the CE mark.

Range

3UA5: 0.1 to 120A, (Class 10A, without CT)

3UA6: 85 to 630A, (Class 10A, CT operated)

3UC5/6: 2.4 to 400A (Class 30, CT operated)

Relay overview

Overload relay operates on the bi-metallic principle. The heater winding wound on the bimetal strips carry the current flowing through the motor. In case of overload, the current carried through the heater winding is more than the rated current. This heats up the bimetal strips. Due to this bi-metal strips bend and open the NC contact of the relay, which is connected in the control circuit of the contactor, thus disconnects the motor from the supply. The tripping time is inversely proportional to the current flowing through the bi-metal strips. Bi-relays are therefore, referred to as "current dependent" and inverse-time delayed relays.

1. Connection for mounting onto contactors:

Optimally adapted in electrical, mechanical and design terms to the contactors, these connecting pins can be used for direct mounting of the overload relays. Stand-alone installation is possible as an alternative (in some cases in conjunction with a stand-alone installation module).

2. Selector switch for manual/automatic RESET (blue):

With this switch you can choose between manual and automatic RESET. A device set to manual RESET can be reset locally by pressing the RESET button. A remote RESET is possible using the RESET modules (accessories), which are independent of size.

3. TEST button (red):

Trip circuit can be manually checked by using this button. During this simulation the NC contact (95-96) is opened and the NO contact (97-98) is closed. This tests whether the auxiliary circuit has been correctly connected to the overload relay. The relay must be reset with the RESET button if it has been set to manual RESET. If the thermal overload relay has been set to automatic RESET, then the overload relay is automatically reset when the TEST button is released.

4. Motor current setting dial:

Setting the device to the rated motor current is easy with the large rotary knob. (Recessed dial, hence no possibility of accidentally change in current setting.)

5. Trip indicator (Green):

A separate mechanical Green Trip Indicator is provided on the front cover of the relay to indicate the tripped state of the 'manual reset' relay.

Recovery time

After tripping due to overload, the thermal overload relays require some time until the bimetal strips have cooled down. The device can only be reset after the bimetal strips have cooled down. This time (recovery time) depends on the tripping characteristics and strength of the tripping current. The recovery time allows the load to cool down after tripping due to overload.

Benefits and features

High performance

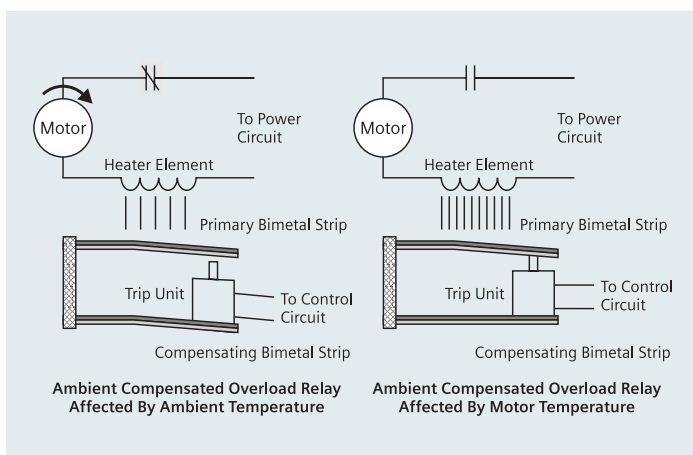

- **In-built single phasing protection**

In case of phase loss the current through the other two windings increases by 1.732 times the rated current of the motor. The current now flows only through the 2 bimetallic strips which should produce the required force on the tripping mechanism. This needs higher currents for longer time. As current is not too high so the relay might take higher time to trip. This can cause damage to the motor. Similar condition happens in case of phase unbalance. To take care of these conditions our birelays are constructed such that they offer a built-in single phasing protection using differential slider principle.

- **Temperature compensation**

The temperature compensation feature reduces the effect of the ambient temperature on the tripping behavior. This ensures the minimum tripping current lies within the specified range

for -25 to 55° C. For this purpose the relays are temperature compensated between service temperatures of -25° C to +55° C.

User friendliness and safety

- **SIGUT termination Technique**

- **Shrouded auxiliary terminals**

Increases safety, as they protect against accidental contact with live parts.

- **Funnel shaped cable entries**

Reduce wiring time by facilitating quick location of the connecting wire.

- **Cable end-stop**

They decide the insertion depth of the connective wire. As the wire cannot now protrude into the relay housing, it does not hamper the movement of the auxiliary contacts. Since the insertion depth is predetermined, insulation of the cable can be cut accordingly and the possibility of insulation getting inadvertently caught under the terminal, is avoided.

- **Captive Screws**

This feature prevents the screws from falling down thereby facilitates the wiring. Hence, the relays are delivered with untightened terminals. This eliminates the operation of untightening terminals before wiring.

- **Lug less termination**

This feature helps in reducing the termination time.

- **Screw-driver guides** reduce wiring time as they allow the use of power screw-drivers.

Flexibility

- **Potential free Auxiliary Contacts**

Potential free 1NO + 1NC contact arrangement is provided as a standard feature. The 1NC contact is used in the control circuit of the contactor for disconnecting the motor in case of overload, whereas the 1NO contact can be used for various applications such as indication.

- **Mounting**

3UA5: suitable for direct mounting or independent mounting (with the help of independent mounting accessory)

3UA6 and 3UC5/6: suitable for Independent mounting.

Finely started with end sleeve	sqmm	2 x (0.75 to 1.5)										
Terminal screw		M3.5										

* For relay above 180 A

Characteristic Curves

Tripping characteristics

The current/time curves show the relationship between the tripping time from cold state and multiples of the set current I_e . When the relay is at operating temperature and carrying 100 % I_e , the tripping times are reduced to approximately 25 %. Tripping curve is applicable to 3-pole loads and 2-pole loads. For single-pole loads, the tripping curves lie between curves of 3-pole loads and 2-pole loads.

For normal operation, all 3 bimetallic strips of the overload relay must be heated. The overload relays 3UA / C are suitable for protecting motors with phase control. For protecting single-phase or DC-loads, therefore, all three main conducting paths must be connected in series. Tripping curve for 3 pole loads is then applicable. The release current with a 3-pole symmetrical load is between 105 % and 120 % of the set current.

The above curves are the general characteristics curves; for individual characteristics curves of each rating, please contact our nearest sales office.

Accessories and ordering data

1. **Adaptor:** To convert contactor mounting relay to independent mounting, (Fig. 1) suitable for screw type mounting and 35 mm DIN rail mounting.
2. **Protective cover*:** To avoid tampering of the setting, auto manual mode or test button. (Fig. 2)
3. **Reset cord*:** To reset the relay in switchboard with door closed. (Length: 600 mm) (Fig. 3)
4. **Reset plunger with funnel*:** Instead of reset cord for resetting the relay in switchboard with door closed. (Fig. 4)

Motor Protection Circuit Breakers

3VU13 and 3VU16

3VU13/3VU16 is suitable for use in fuseless motor feeders upto 11KW/22KW (25A/63A) respectively. 3VU motor protection circuit breakers are used for protection of motor against overload, single phasing and short-circuit faults.

Applications

- **Motor Protection**

Circuit breakers type 3VU13 & 3VU16 offer overload, short circuit and phase loss protection for 3 phase motors upto 11kW and 22 kW respectively. The breaker has a toggle switch for ease of operation and can be offered with auxiliary contacts, trip indicating contacts, U/V or Shunt release. High breaking capacity of 100kA is available in 3VU13 upto 6A and in 3VU16 upto 25A.

- **Distribution Feeder Protection**

Standard version of 3VU13 and 3VU16 has adjustable O/L and fixed S/C release. Main application is for disconnection and protection of the distribution feeders, upto 25A and 63A respectively. A large number of overlapping ranges are available for offering closer protection to various loads.

- **Transformer protection**

A separate 3VU13 range can be offered to protect the primary side of the transformers. The range is available upto 20A. To take care of the inrush current due to transformer switching, the S/C release is set at 19 times the rated current unlike 12 times of the rated current available in standard range.

- **Fuse Monitoring**

3VU1340-1MS00 is offered for Fuse Monitoring application. This device is connected in parallel to the fuses. In case one of the fuses blows, the rated current will flow through the corresponding phase of this MPCB. MPCB, through its auxiliary contacts, provides a tripping signal to the contactor and thus the motor will be switched off. Hence, the motor will be protected from single phasing. (Refer page 51 for connection diagram)

3VU13/16

Standard

3VU motor protection circuit breakers conform to IS/IEC 60947-1, IS/IEC 60947-2, IS/IEC 60947-4-1, DIN VDE 0660

Range

3VU13: 0.16 - 25A

3VU16: 10 - 63A

Benefits and features

High performance

- **Instantaneous Tripping**

3VU circuit breakers operate on the **Current Limiting Principle**.

Current Limiting Principle

In case of short-circuit condition motor protection circuit breaker trips before the short-circuit current reaches the prospective peak. Hence, for circuit breaker to be current limiting it must interrupt the short-circuit current in half cycle or less as shown below.

Fuse Monitoring MPCB - 3VU1340-1MS00

Current Limiting is achieved in 3VU as follows

In case of a short circuit, the contacts are opened electro-dynamically by the short circuit current. The instantaneous overcurrent release, through the switching mechanism, trips all the three poles of the breaker. A large arc voltage is quickly built up in the arc chamber limiting the short circuit current. Thus ensures faster fault clearing.

- Ambient temperature compensation upto 55°C hence no deration required upto 55°C.

Safety

• Trip Free Mechanism

The breakers have a trip-free mechanism. Even by holding the toggle, tripping operation can not be stopped or blocked once it is started. Thus ensure positive opening in the event of fault.

- Positive ON/OFF indication through toggle switch
- Compact and space saving

User friendliness and safety

- SIGUT® connection technique ensures ease of wiring (can obviate use of lug)
- Fingers touch proof terminals ensures operator safety
- Separate trip indication on short circuit and overload fault using alarm contact

Flexibility

- Can be used as a main and EMERGENCY STOP switch.
- Identical accessories reduce stock levels

Accessories:

RHS	Alarm contact (1NO + 1NC)	When short circuit (and not overload) occurs, alarm contact 1NO+1NC changes over which can be used to give indication. We need to reset it manually after clearing of short circuit. It performs a function of reclosing lockout.
		and/or
	Auxiliary Contact (1NO + 1NC)	This contact can be added to the MPCB with or without built -in 1NO+1NC contact.
LHS	Shunt Release	Shunt trip is used for remotely tripping the MPCB.
		or
	Undervoltage Release	It trips the MPCB on voltage interruption, preventing the undesirable restart of the motor.
On Top (applicable to 3VU13 only)	Current Limiting Module (independent mounting)	For increasing breaking capacity of 3VU13 to 50kA for 8 - 25A

Current-Limiter

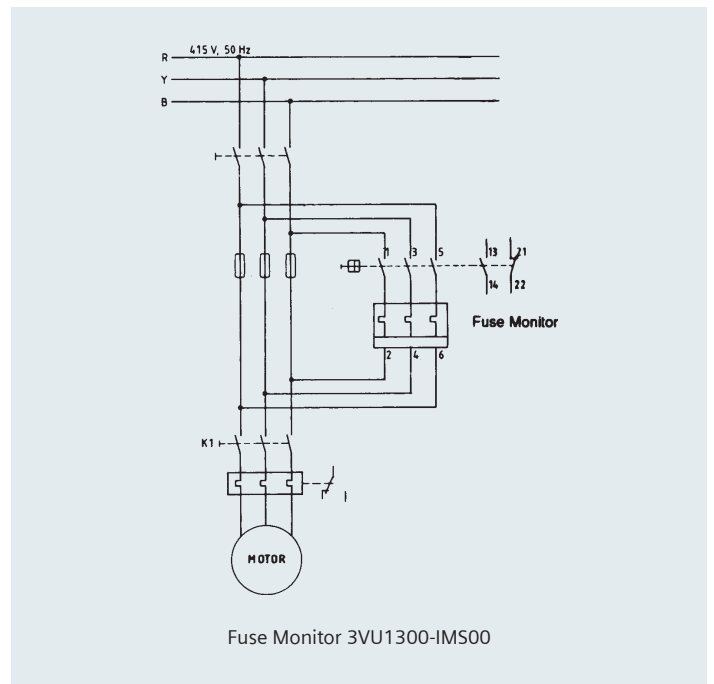

The breaking capacity of 3VU13 is 100kA upto 6A. However for 3VU circuit breakers with rated current of 8A and 10A the short-circuit breaking capacity is 10kA. For circuit breakers with rated current from 16A to 25A the short-circuit breaking capacity is 6kA. In order to enhance the breaking capacity to 50kA, for these ratings (8A to 25A), the current limiter can be used. Thus the need of back up fuses is obviated.

The current limiter is connected in series with 3VU13 MPCB.

When a short circuit occurs, the limiter trips and in turn opens the downstream MPCB. The auxiliary contacts of the current limiter (1NO+1NC) can be used for signaling whether the limiter has tripped or not.

Several MPCBs can also be connected at the output of a current limiter. However the summation of current ratings of individual MPCBs should not be greater than 56A.

Starters

Overview

Siemens caters with following types of starters to agricultural and industrial sector.

Application

The main purpose of motor starters is to start the electrical motor by switching ON the contactor inside the starter. The relay inside the starter additionally protects the motor in case of overload and single phasing condition. The starter is nothing but a pre-wired assembly of contactor(s), relay and ON-OFF push buttons. Direct on line and star delta are two methods of starting the electric motors which is achieved by our DOL and star delta starter respectively.

Standard

Siemens starters confirms to IS/IEC 60947-4-1

Range

Agricultural starters

3TW42 DOL starters (A1, A2, A3, A4): upto 10Hp

3LW42 Handle operated star delta starters (B1): upto 15Hp

3TS02 Semi-automatic and 3TE02 fully automatic star delta starters (B2, B3, B4): upto 25Hp

Industrial starters

3TW04 DOL and 3TE04 star delta starters (C1, C2): upto 75Hp

Benefits and features

Flexibility

- **Starters with or without enclosure**
Pre-wired DOL as well as star delta starters are available either in open execution or in sheet steel enclosure.
- **Industrial starters without relay**
Industrial DOL as well as star delta starters have provision for mounting relay but the relay is not provided in the starter. Thus offering flexibility of selecting 3UA relay range as per customers requirement.

Reliability

- **Wide band coil voltage**
Agricultural DOL starters are having option of 200-400 V and agricultural star delta starters are having option of 230-400 V coil voltage which takes care of wide fluctuations in the supply voltage occurring especially in the remote places.

High performance

- **In-built single phasing protection**
In case of phase loss the current through the other two windings increases by 1.732 times the rated current of the motor. The current now flows only through the 2 bimetallic strips which should produce the required force on the tripping mechanism. This needs higher currents for longer time. As current is not too high so the relay might take higher time to trip. This can cause damage to the motor. Similar condition happens in case of phase unbalance. To take care of these conditions our birelays provided in the starters are constructed such that they offer a built-in single phasing protection using differential slider principle.

Useful technical information

Method of starting

A. DOL starting method:

The most economical and popular method of starting squirrel cage induction motors, is direct-on-line, where the starter is connected directly across the supply. However, the starting current at the moment of switching Direct-on-line can be as high as 6-8 times the rated current.

Advantages: High starting torque, shorter starting time, simple construction and wiring, space saving etc.

Disadvantages: High starting current

Types:

Agricultural Starters

A1. RAJA DOL starter

Construction

Contactor:

The DOL starter up to 10 HP is fitted with 3TW02 contactor. This contactor is specially designed by Siemens considering the requirements of industry as well as agriculture. Considering the specific need of the agricultural pump set applications, Siemens has designed a special wide band coil (200- 400V). This coil operates reliably even when there is wide voltage fluctuation. The contact rating of this contactor is 20 A. This high contactor rating has made RAJA starter the most suitable starter for applications where current for given HP is higher than that of the conventional motors' e.g.. Submersible pumps etc.

Bimetal Overload Relay:

The RAJA direct-on-line starter is fitted with 3UW50 relay. These relays are computer calibrated and therefore, offer accurate protection. The main benefit of this bimetal relay is the built-in single phasing protection in addition to the overload protection. This relay is automatic reset type and can not be reset by hand.

Push buttons

Push buttons are used for switching 'ON' and 'OFF' the starter.

Operation:

In DOL starting, the 'ON' push button is pressed, which energizes the contactor coil, thus switching on the circuit. When the OFF' push button is pressed, the contactor is de-energized, switching off the circuit. The bimetal relay under normal functioning of motor plays no active part in the starter. But under overload, single phasing or locked rotor conditions of Motor, the bimetal relay cuts-off the supply to the contactor coil, tripping the circuit. The contactor itself provides the necessary 'no-voltage' protection in so far as it will drop out in the case of a supply failure, and for restarting on resumption of supply, the 'ON' push button will have to be pressed again.

A2. RAJA DOL stater in open execution:

This starter is exactly same as DOL starter with sheet steel housing except the enclosure and push buttons. The contactor and birelays are wired and mounted on the plate. It is expected that the user provides for the housing for this starter and also for the ON-OFF arrangement by way of push buttons or any other means.

A3. RAJA DOL starter with hand reset:

This starter is exactly same as RAJA DOL starter with sheet steel housing but in this case the relay needs to be reset manually. The OFF button on the housing is also used as reset button for resetting the relay after overload.

A4. DOL starter with lockable off:

This starter is exactly same as RAJA DOL starter with sheet steel housing but the relay needs to be reset manually by pressing OFF PB. Locking arrangement is provided for OFF push button; so starter can't be switched ON, inadvertently.

B. Star delta starting method:

In star delta starting, initially the motor windings are connected in star. This reduces the starting current by $1/\sqrt{3}$ rd of the full load current also the voltage by $(1/\sqrt{3})$ of the rated value. As the torque is proportional to the square of the voltage, the starting torque also get reduced to $1/3$ rd of it's full load value. Once the motor attains approximately 80% of the rated speed, the windings get connected in the delta formation.

Thus by star delta starting, the starting current is reduced to 2 to 2.5 times the rated current unlike DOL starting, where it is 7 to 8 times of the rated current.

Advantages: low starting current

Disadvantages: Low / medium starting torque, longer starting time, less simpler construction and wiring, requires more space etc.

B1. Handle Operated Star Delta Starter (3LW42)

In this starter, the changeover from 'star' to 'delta' is done manually through a control switch.

Construction:

It consists of a star-delta switch (3LAO), contactor (3TW02), an overload relay (3UW50), "Reset" push button and a safety 'ON' push button.

Operation:

To start the motor, move the 3LAO switch handle from 'O' position to 'star' (Y) position with the right hand and press the start - (I) push button with your left hand. The motor starts and when it has almost come to its rated speed (indicated when the motor hum reaches a steady pitch), turn the handle to 'delta' position, still ensure to keep the push button pressed. After switching to delta, the push button and the switch handle can be released. To stop the motor, bring the handle of the switch to 'O' position. If the starter trips automatically due to any fault, the switch handle is first to be brought to 'O' position and the bimetal relay has to be reset.

B2. Semi automatic Star-Delta Starter (3TS02)

In this starter, the changeover from 'star' to 'delta' is done manually by pressing ON push button.

Construction:

It consists of three contactors (3TW03), bimetal overload relay (3UW50), and push buttons (ON-OFF, Reset) for control command.

Operation:

To start the motor, ON' push button is pressed and the same is hold for 6 to 8 sec (starting time of the motor). After 6-8 sec, it is left. After this, motor automatically changes over from star to delta. The OFF push button has been provided to switch off the entire circuit.

B3. Fully automatic Star-Delta Starter (3TE02)

In this starter, the changeover from 'star' to 'delta' is done automatically after a preset time by using a timer.

Construction:

It consists of three contactors (3TW03), bimetal overload relay (3UW50), electronic timer (3RP) for automatic changeover from 'star' to 'delta' and push buttons (ON-OFF, Reset) for control command.

Operation:

To start the motor, ON' push button is pressed, the line contactor and the star contactor switch-on connecting motor windings in star formation on reduced voltage. After the preset time, the timer automatically switches off the 'star' contactor and switches 'ON' the 'delta' contactor, thus after the starting period, the motor runs on full voltage. The OFF push button has been provided to switch off the entire circuit.

B4. Fully automatic star delta starter in open execution

This starter is exactly same as fully automatic starter in sheet steel housing expect the enclosure and push buttons. The contactor and birelays are wired and mounted on the plate.

C. Industrial Starter:

C1. DOL (3TW04):

This starter is similar to RAJA DOL starter with sheet steel housing (3TW42901A). In order to offer flexibility of selecting exact 3UA relay range by the customer, this starter has only provision for mounting the bi-relay but the birelay is not provided in the starter. Customer is required to select the suitable bi-relay and mount it in the starter before putting it in service.

C2. Star Delta (3TE04):

This starter is similar to star delta starter with sheet steel housing (3TE02). In order to offer flexibility of selecting exact 3UA relay range by the customer, this starter has only provision for mounting the bi-relay but the birelay is not provided in the starter. Customer is required to select the suitable bi-relay and mount it in the starter before putting it in service.

Fuse protected selection type 2, Iq = 50kA, IS/IEC: 60947-4-1

- The selection is valid only for complete Siemens combinations i.e. SDF + DIN Fuse + Contactor + Bi-Relay (+ timer).
- In case this combination is changed to accommodate another brand/rating of SDF/DIN Fuse/Contactor/BMR, it shall be the responsibility of the person making such a change to assure type 2 performance.
- Selection is for normal starting conditions with starting time ≤ 6 seconds. For heavy starting applications (e.g. ID/FD fans, reciprocating compressors, ball mills etc.), please consult Siemens.
- At 60°C service temperature the bi-relay has to be derated. The bi-relay can be used upto the maximum current setting indicated. For example - A bi-relay with setting 32-50A, at 60°C can be used only upto 47A. This however does not mean that at 60°C, the 50A setting corresponds to 47A. It means that, the bi-relay should not be set beyond 47A.
- The electronic star-delta timer type 3RP should be used in star-delta feeders.
- SDF: Switch Disconnecter Fuse. All fuses are DIN HRC type.
- Tested Type 2 combinations
- Low LCC = Low Life Cycle Cost

Direct-on-line feeder, for Low LCC

Fuseless selection type 2, Iq = 50kA, IS/IEC: 60947-4-1

- The selection is valid only for complete Siemens combinations i.e. MPCB / MCCB + contactor + bi-relay (+timer).
- In case this combination is changed to accommodate another brand/rating of MPCB/MCCB/contactor/BMR, it shall be the responsibility of the person making such a change to assure Type 2 performance.
- Selection is for **normal starting** conditions with starting time ≤ 6 seconds. For **heavy starting** applications (e.g. ID/FD fans, reciprocating compressors, ball mills etc.), please consult Siemens.
- The **electronic star-delta timer type 3RP** should be used in star-delta feeders.
- Truly tested Type 2 combinations at neutral authorities.
- Low LCC = Low life cycle cost

Direct-on-line feeder, for low LCC

#3RV11 comes with integral relay function, hence external bi-relay is eliminated.

MPCB with 'standard release' can also be used.

* 3RV10 MBCB comes with built in overload protection hence no need to use an external overload relay; 3RV13 Mag only MPCB can also be used, however an external overload relay is required

1. Please use Electronic Star delta time type 3RP15 for the changeover from star to main.

2. Selection valid for Normal starting of the motors with starting time upto 10 seconds

3. Minimum auxiliary contacts for K1= 1NO+1NC, for K2=1NO, for K3=1NC and for contactor relay K5=2NO

4. Selection for higher ratings upon request.
